

Inter-Integrated Circuit : I²C

Microcontroller Application and Development 2566

Sorayut Glomglome

I2C

- I2C เป็นโปรโตคอลสื่อสารอนุกรม ประกอบด้วยขาสัญญาณ
 - SDA: สัญญาณข้อมูล
 - SCL: สัญญาณนาฬิกา
 - <https://www.youtube.com/watch?v=6IAkYpmA1DQ>

STM32F767 I2C

- I²C Master features:
 - Clock generation
 - Start and Stop generation
- I²C Slave features:
 - Programmable I²C Address detection
 - Dual Addressing Capability to acknowledge 2 slave addresses
 - Stop bit detection
- Supports different communication speeds:
 - Standard Speed (up to 100 kHz)
 - Fast Speed (up to 400 kHz)
 - The I2C bus frequency can be increased up to 1 MHz. For more details about the complete solution, please contact your local ST sales representative

Mode selection

The interface can operate in one of the four following modes:

- Slave transmitter
- Slave receiver
- Master transmitter
- Master receiver

By default, it operates in slave mode. The interface automatically switches from slave to master, after it generates a START condition and from master to slave, if an arbitration loss or a Stop generation occurs, allowing multimaster capability.

STM32F767 I2C

- Slave and master modes, multimaster capability
- Standard-mode (Sm), with a bitrate up to 100 kbit/s
- Fast-mode (Fm), with a bitrate up to 400 kbit/s
- Fast-mode Plus (Fm+), with a bitrate up to 1 Mbit/s and 20 mA output drive I/Os
- 7-bit and 10-bit addressing mode
- multiple 7-bit slave addresses

STM32F767 I2C

Table 7. I2C implementation

I2C features ⁽¹⁾	I2C1	I2C2	I2C3	I2C4
Standard-mode (up to 100 kbit/s)	X	X	X	X
Fast-mode (up to 400 kbit/s)	X	X	X	X
Fast-mode Plus with 20 mA output drive I/Os (up to 1 Mbit/s)	X	X	X	X
Programmable analog and digital noise filters	X	X	X	X
SMBus/PMBus hardware support	X	X	X	X
Independent clock	X	X	X	X

1. X: supported.

Mode selection

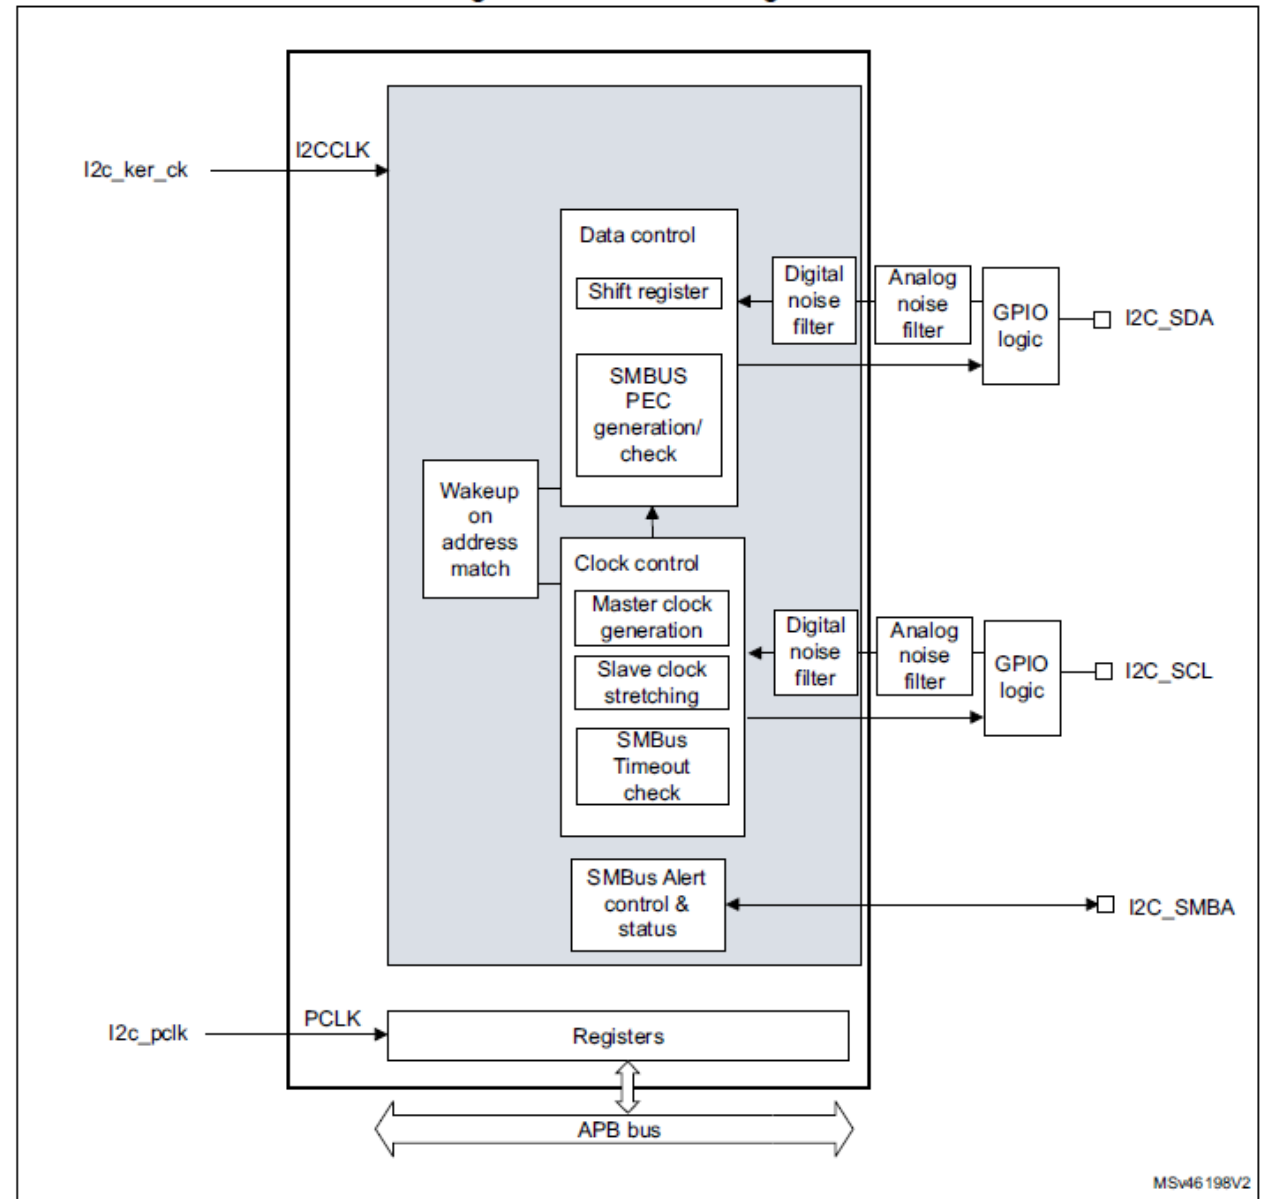

The interface can operate in one of the four following modes:

- Slave transmitter
- Slave receiver
- Master transmitter
- Master receiver

By default, it operates in slave mode. The interface automatically switches from slave to master, after it generates a START condition and from master to slave, if an arbitration loss or a Stop generation occurs, allowing multimaster capability.

STM32F767 I2C

Figure 349. I2C block diagram

Communication Flow

- In Master mode, the I2C interface initiates a data transfer and generates the clock signal.
- A serial data transfer always begins with a START condition and ends with a STOP condition.
- Both START and STOP conditions are generated in master mode by software.

Communication Flow

- In Slave mode, the interface is capable of recognizing its own addresses (7 or 10-bit), and the General Call address.
- Data and addresses are transferred as 8-bit bytes, MSB first. The first byte(s) following the START condition contain the address (one in 7-bit mode, two in 10-bit mode).
- The address is always transmitted in Master mode.

I2C UNO Pins : D14 & D15

AOSONG

Digital Temperature and Humidity Sensor AM2320 Product Manual

Product Features:

- Ultra-small size
- Super cost-effective
- Ultra-low voltage operation
- Excellent long-term stability
- Standard I2C and single-bus output

For more information, please visit: www.aosong.com

AM2320

- Digital Temperature & Humidity Sensor
- Standard I2C and single-bus output (1Wire)
- CRC checksum

Table 4: AM2320 pin assignment

Pin	Name	Description
1	VDD	Power supply(3.1-5.5V)
2	SDA	Serial data, bidirectional port
3	GND	Ground
4	SCL	Serial clock input port (single bus ground)

Sensor performance : Relative Humidity

Table 1: AM2320 relative humidity performance table

parameter	condition	min	typ	max	unit
resolution			0.1		%RH
Range		0		99.9	%RH
Accuracy	25°C		±3		%RH
Repeatability			±0.1		%RH
Interchangeability		Completely interchangeable			
Response time	1/e(63%)		<5		S
Sluggish			±0.3		%RH
Drift	Typical values		<0.5		%RH /yr

Figure 2: 25 °C relative humidity of maximum error AM2320

Sensor performance : Temperature

Table 2: AM2320 relative temperature performance table

parameter	condition	min	typ	max	unit
resolution			0.1		°C
			16		bit
Accuracy			± 0.5		°C
Range		-40		80	°C
Repeatability			± 0.2		°C
Interchangeability					
Response time	1/e(63%)		<5		S
Drift			± 0.1		°C/yr

Figure 3: The maximum error of the temperature sensor

AM2320 Wiring

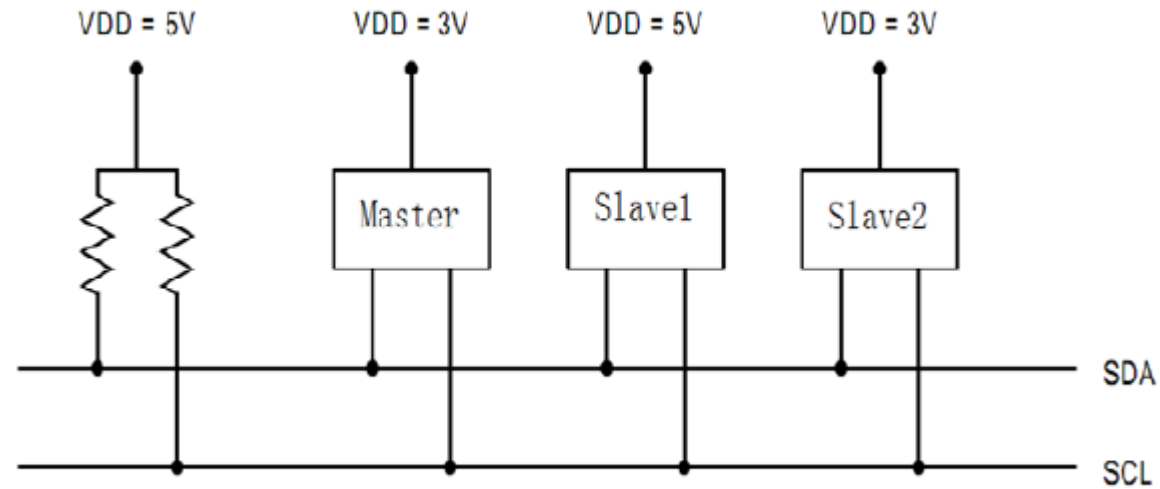

Figure 5: I²C typical configuration

Data Packet Format

© Communication data (information frame) format

Data formats:

Data length:

I ² C data+W/R	Function Code	Data Area	CRC
1byte	1 byte	N-byte	16-bit CRC (cyclic redundancy code)

Table 7:C Mod Bus part of the function code

Function Code	Definitions	Operation (binary)
0x03	Reading Register Data	Read one or more data registers
0x10	Write Multiple Registers	Multiple sets of binary data to write multiple registers

AM2320 Registers

Table 8: AM2320 Data Register Table

Register information	Address	Register information	Address	Register information	Address	Register information	Address
High humidity	0x00	Model High	0x08	Users register a high	0x10	Retention	0x18
Low humidity	0x01	Model Low	0x09	Users register a low	0x11	Retention	0x19
High temperature	0x02	The version number	0x0A	Users register 2 high	0x12	Retention	0x1A
Low temperature	0x03	Device ID (24-31) Bit	0x0B	Users register 2 low	0x13	Retention	0x1B
Retention	0x04	Device ID (24-31) Bit	0x0C	Retention	0x14	Retention	0x1C
Retention	0x05	Device ID (24-31) Bit	0x0D	Retention	0x15	Retention	0x1D
Retention	0x06	Device ID (24-31) Bit	0x0E	Retention	0x16	Retention	0x1E
Retention	0x07	Status Register	0x0F	Retention	0x17	Retention	0x1F

Sending Command to AM2320 to Read Data

1. Function code "03": Read registers multiplexed sensor

The host sends reading frame format:

START + (I²C address + W) + function code (0x03) + start address + number of registers
+ STOP

Host read return data:

START + (I²C address + R) + sequential read sensor data returned + STOP

Sensor response frame format:

Function code (0x03) + number + data + CRC^[1]

For example: Host sequential read sensor data: the starting address for the register data of four sensors 0x00.

Sensor data register address and data:

Register Address	Register data	Data Description	Register Address	Register data	Data Description
0x00	0x01	High humidity	0x02	0x00	High temperature
0x01	0XF4	Low humidity	0x03	0xFA	Low temperature

Host message format sent:

The host sends	Byte count	Transmitting information	Remarks
Sensor address	1	0xB8	Sensor C address (0xB8) + W (0)
Function Code	1	0x03	Read register
Starting address	1	0x00	Register start address is 0x00
Number of registers	1	0x04	Read the number of register

AM2320 Respond with Data

Slave response	Byte count	Transmitting information	Remarks
Function Code	1	0x03	Read register
Returns the number of bytes	1	0x04	Returns 4 of 4 byte register
Register 1	1	0x01	Address for the content of 0x00 (high humidity bytes)
Register 2	1	0XF4	Address for the content of 0x01 (low humidity bytes)
Register 3	1	0x00	Address for the content of 0x01 (low humidity bytes)
Register 4	1	0XFA	Address for the content 0x03 (temperature low byte)
CRC code	2	31A5	Sensors calculate the CRC code returned, low byte first;

Humidity: $01F4 = 1 \times 256 + 15 \times 16 + 4 = 500 \Rightarrow \text{humidity} = 500 \div 10 = 50.0\%RH$;

Temperature: $00FA = 15 \times 16 + 10 = 250 \Rightarrow \text{temperature} = 250 \div 10 = 25.0^{\circ}C$

Timing Diagram : Step 1 Wake Sensor

- the starting signal + 0xB8 + wait (> 800us) + stop signal

Timing Diagram : Step 2 Send Read Command

- The host sends commands to: START + 0xB8 (SLA) + 0x03 (function code) + 0x00 (starting address) + 0x04 (register length) + STOP

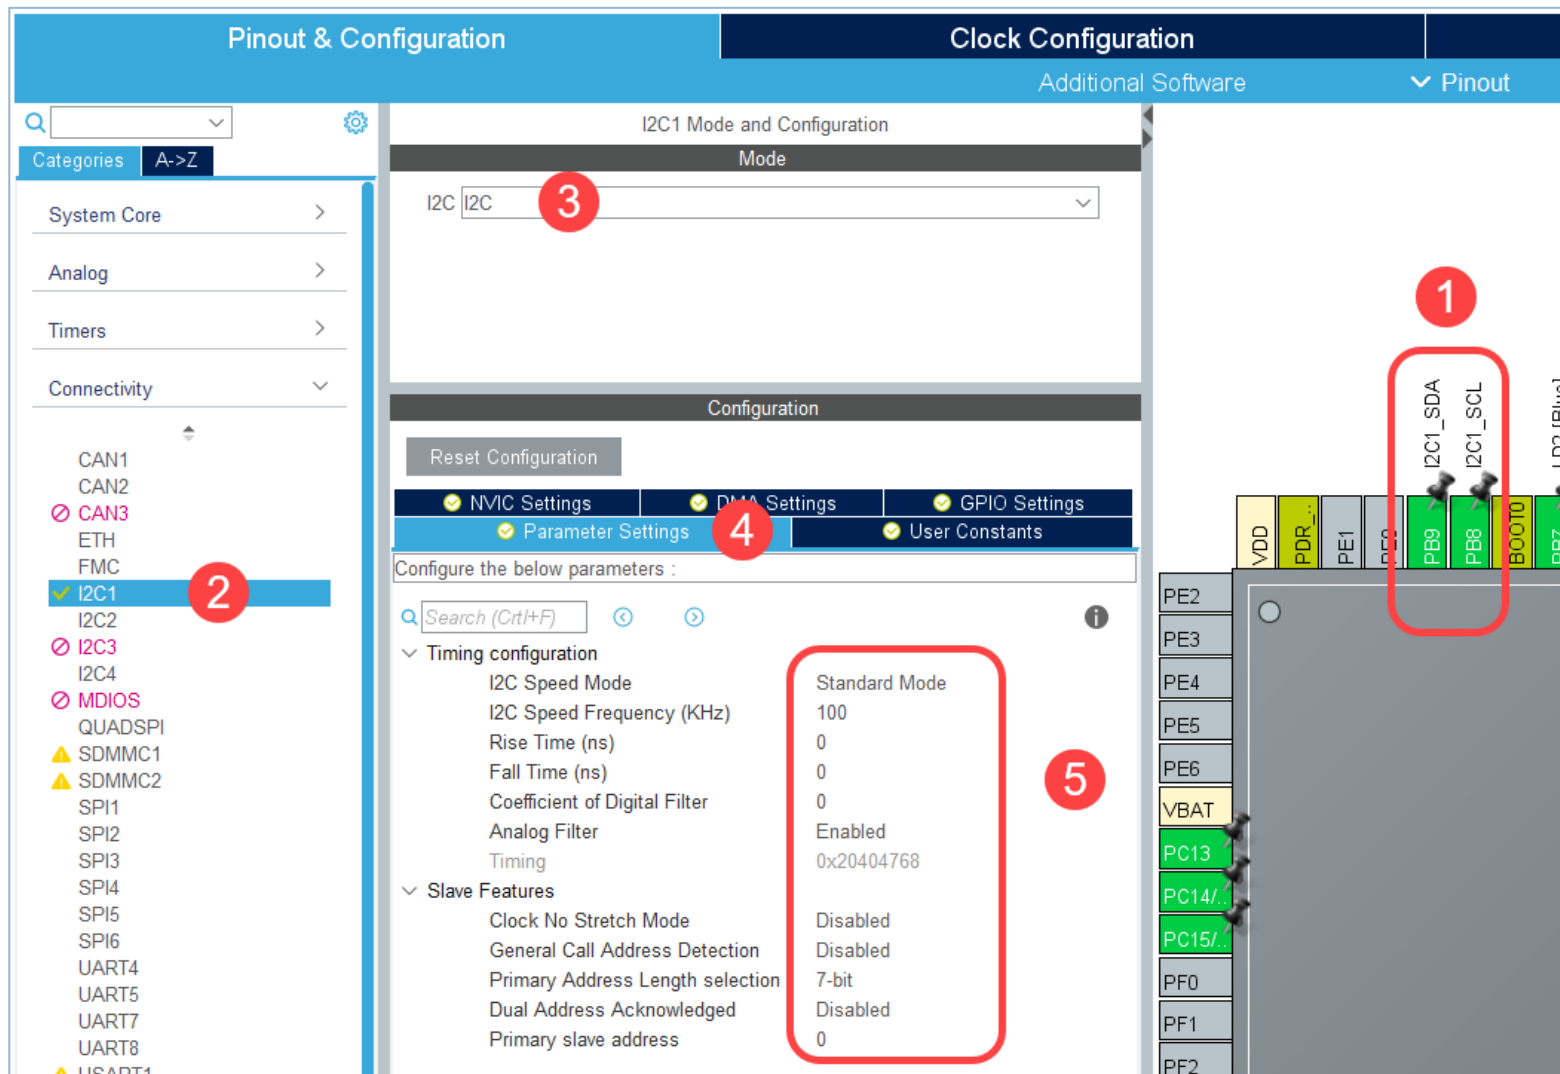

Timing Diagram : Step 3 Receive Sensor Data

Host read back the data as follows:

- **0x03** (Function Code) + **0x04** (data length) +
0x03 (high humidity) + **0x39** (low humidity) +
0x01 (high temperature) + **0x15** (low temperature) +
0xE1 (CRC checksum low byte) + **0xFE** (CRC checksum high byte)
- Therefore: **0339H** = $825_{10} \Rightarrow \text{humidity} = 825 \div 10 = 82.5\% \text{ RH}$
0115H = $277_{10} \Rightarrow \text{temperature} = 277 \div 10 = 27.7 \text{ }^{\circ}\text{C}$

Setting STM32Cube for I2C (AM2320)

Additional Setting STM32Cube for I2C (AM2320)

- Config PD8 & PD9 as UART3
- Config PB0 as LED1

I2C HAL Lib

Polling mode IO operation

- Transmit in master mode an amount of data in blocking mode using HAL_I2C_Master_Transmit()
- Receive in master mode an amount of data in blocking mode using HAL_I2C_Master_Receive()
- Transmit in slave mode an amount of data in blocking mode using HAL_I2C_Slave_Transmit()
- Receive in slave mode an amount of data in blocking mode using HAL_I2C_Slave_Receive()

Interrupt mode IO operation

- Transmit in master mode an amount of data in non blocking mode using HAL_I2C_Master_Transmit_IT()
- At transmission end of transfer HAL_I2C_MasterTxCpltCallback is executed and user can add his own code by customization of function pointer HAL_I2C_MasterTxCpltCallback
- Receive in master mode an amount of data in non blocking mode using HAL_I2C_Master_Receive_IT()
- At reception end of transfer HAL_I2C_MasterRxCpltCallback is executed and user can add his own code by customization of function pointer HAL_I2C_MasterRxCpltCallback
- Transmit in slave mode an amount of data in non blocking mode using HAL_I2C_Slave_Transmit_IT()
- At transmission end of transfer HAL_I2C_SlaveTxCpltCallback is executed and user can add his own code by customization of function pointer HAL_I2C_SlaveTxCpltCallback
- Receive in slave mode an amount of data in non blocking mode using HAL_I2C_Slave_Receive_IT()
- At reception end of transfer HAL_I2C_SlaveRxCpltCallback is executed and user can add his own code by customization of function pointer HAL_I2C_SlaveRxCpltCallback
- In case of transfer Error, HAL_I2C_ErrorCallback() function is executed and user can add his own code by customization of function pointer HAL_I2C_ErrorCallback
- Abort a master I2C process communication with Interrupt using HAL_I2C_Master_Abort_IT()
- End of abort process, HAL_I2C_AbortCpltCallback() is executed and user can add his own code by customization of function pointer HAL_I2C_AbortCpltCallback()

Show result in Tera Term via UART2

The screenshot shows a Tera Term window titled "Tera Term - [disconnected] VT". The menu bar includes "File", "Edit", "Setup", "Control", "Window", and "Help". The main text area displays the output of an AM2320 I2C DEMO, which starts with "AM2320 I2C DEMO Starting . . .". It then shows six rows of temperature and humidity data. The first row shows a temperature of 40.0 and humidity of 30.0, while the subsequent five rows show a temperature of 26.9 and humidity values ranging from 56.2 to 65.2. A black cursor is visible at the bottom left of the text area.

```
